

## Control Station

### COSA Control Station

The COSA Control Station is the reporting and monitoring tool for management staff. Critical tendencies can be identified at an early stage and represented in different ways. Various configurable alarm functionalities make sure that potential interferences are detected.

However, the COSA Control Station does not only allow to detect critical situations at an early stage, but also enhances active interventions in running processes. For example, you can modify roles on a temporary basis to bypass resource bottlenecks without changing basic role definitions, e. g. in LDAP.

Processes that do not follow the standard routines can be accelerated by changing process or activity priorities. Business Process Management (BPM) and Workflow Solutions by COSA - The BPM Experts
